1. Web Application Concept - GameMatch AI

Overview

GameMatch AI is a personalized, interactive web application designed to recommend video games based on the logged-in user's specific characteristics and current preferences. By processing user input through an engaging quiz and applying an intelligent scoring algorithm, the application curates a Top 10 list of recommended games from an extensive database of nearly 600 titles.

Core Features & Functionality

1. **User Authentication & Profiles:** Users can log in to save their preferences, demographics (age, gender), and view their past recommendations.
2. **Interactive Quiz Interface:** A dynamic, multi-step form that captures real-time data:
 - **Device Options:** PC, consoles, mobile, etc.
 - **Time Availability:** Short sessions, long sessions, etc.
 - **Mood/Goal:** Relaxing, competitive, story-driven, etc.
3. **Simulated AI Processing:** Once the quiz is completed, users are presented with a "Processing" screen that simulates an AI analyzing their profile and the database.
4. **Top 10 Game Recommendations:** The algorithm filters incompatible games (by platform) and scores the rest based on user input, finally displaying the top 10 best matches.

Content for Presentation Slides (Task 1)

- **Slide 1.1: Project Introduction:** Title of the App (GameMatch AI), team members, and the main objective of the application.
- **Slide 1.2: The Problem:** Gamers often face "choice paralysis" due to the overwhelming number of available games.
- **Slide 1.3: The Solution:** A smart recommender system that asks the right questions to suggest the right games.
- **Slide 1.4: Key Features:** Highlighting the User Login, Interactive Quiz, AI Feedback loop, and Top 10 Gallery.
