

Here is the comprehensive presentation structure and script for your project, **GameMatch AI**. It is designed to be engaging, professional, and evenly distributed among your team.

Slide 1: Introduction

Speaker: Ander

Slide Title: Welcome to GameMatch AI: Finding Your Next Adventure **On-Screen**

Bullets:

- Project Reveal: **GameMatch AI**
- The Problem: Decision paralysis in an oversaturated gaming market
- Our Solution: An intelligent, algorithm-driven recommendation engine
- Meet the Development Team

Speaker Notes (Script):

"Hello everyone, and welcome. Have you ever spent more time scrolling through Steam, the PlayStation Store, or Xbox Game Pass trying to find a game to play than actually playing one? You're not alone. In today's oversaturated market, decision paralysis is a massive problem for gamers. There are simply too many choices.

That is the problem we set out to solve. We are thrilled to introduce you to **GameMatch AI**.

GameMatch AI is a web application featuring an intelligent, automated recommendation engine. Instead of forcing users to filter through endless categories, our app takes them through a dynamic, engaging quiz. Based on their psychological preferences, gameplay style, and current mood, we calculate their perfect video game match.

Making this happen required a full-stack approach, and I'm proud to present the team behind it: I'm Ander, and I'm joined by Oihan, Julen, Liss, and Sanne. We've divided our presentation today to walk you through our database architecture, core logic, frontend design, and the results of our project.

To kick things off, I'll hand the mic over to Oihan, who will take you under the hood of our database."

Slide 2: Database and Connection Structure

Speaker: Oihan

Slide Title: Under the Hood: Architecture & Security **On-Screen Bullets:**

- Relational Database Architecture (MySQL)
- Core Entities: Users, Video Games, Questions, Answers, and Match History
- Secure Connections: PHP PDO & Prepared Statements

*

Speaker Notes (Script):

"Thank you, Ander. To make an intelligent recommendation, you first need a highly organized structure to store and relate data. For GameMatch AI, we built a robust relational database using MySQL.

As you can see on our ER Diagram here on the slide, our architecture is built around five core tables. We have the **Users** table to manage accounts, and the **Video Games** table, which holds our catalog and the specific attributes of each game. The **Questions** and **Answers** tables store our quiz logic, and finally, the

History table acts as the bridge, saving the calculated match results for each user so they can review their past recommendations.

Because we are handling user data and passwords, security was our top priority. We manage our database connections using PHP Data Objects, or PDO. Instead of directly inserting user inputs into our SQL queries, we strictly use prepared statements. This, combined with environment configuration files to hide our credentials, ensures that our application is heavily protected against SQL injection attacks.

But how does this data actually generate a recommendation? I'll pass it to Julien to explain the brains of the operation."

Slide 3: Web Functionality & Core AI Logic

Speaker: Julen

Slide Title: The Engine: Functionality & Core AI Logic **On-Screen Bullets:**

- Seamless User Journey: Register, Dashboard, Play
- Dynamic Quiz Mechanics & Genre Routing
- Attribute Weighting & Scoring System
- Final Match Percentage Algorithm

Speaker Notes (Script):

"Thanks, Oihan. The user journey in GameMatch AI is designed to be seamless. A user registers, logs in to their personalized dashboard, and immediately begins the quiz. But the real magic happens behind the scenes.

Our quiz isn't just a static form; it's dynamic. Depending on how a user answers early questions—for example, indicating a preference for fast-paced action over deep storytelling—the quiz adapts, routing them toward specific genres and filtering out irrelevant data.

To do this, we built a custom weighting system. Every answer in our database carries specific 'weight' values tied to game attributes—like difficulty, multiplayer capabilities, or narrative depth. As the user clicks through the quiz, the application tallies these weights in the background.

When the quiz ends, our algorithm fires. It compares the user's final attribute score against the database of video games, calculating the distance between the user's profile and each game's profile. The algorithm then converts this math into a 'Match Percentage,' pulling the highest-scoring game and presenting it as their ultimate recommendation.

Of course, all this complex logic needs a beautiful interface. I'll hand it over to Liss to talk about our frontend."

Slide 4: Frontend Design & User Experience

Speaker: Liss

Slide Title: Immersive UX: Frontend Design & Interactivity **On-Screen Bullets:**

- Gamer-Centric Aesthetic (Modern Violet/Purple Palette)
- Scalable CSS Architecture (Custom Variables & Theming)
- Mobile-First & Responsive Layouts (CSS Grid/Flexbox)
- Vanilla JavaScript: Dynamic DOM Updates & Seamless Transitions

Speaker Notes (Script):

"Thank you, Julien. For the frontend, our philosophy was simple: the app needed to feel like it belongs in the gaming world. We aimed for an immersive, modern, gamer-centric aesthetic, anchored by a sleek dark mode and a vibrant violet and purple color palette.

To keep our styling organized and scalable, we built a robust CSS architecture using custom CSS variables. This allowed us to maintain consistent theming across the app. We also took a strict mobile-first approach. By utilizing CSS Grid and Flexbox, we ensured that whether a user is taking the quiz on a 4K desktop monitor or a smartphone, the interface remains perfectly responsive and intuitive.

But looking good isn't enough; it has to feel good. We used Vanilla JavaScript to handle all the interactivity. Instead of frustrating page reloads after every single question, JavaScript dynamically updates the DOM. We implemented smooth, sliding transitions between quiz questions, and handled things like mobile menu toggles and live form validation, keeping the user completely immersed in the experience.

Finally, to wrap up our presentation and talk about our results, here is Sanne."

Slide 5: Conclusions & Future Improvements

Speaker: Sanne

Slide Title: Leveling Up: Conclusions & Future Roadmap **On-Screen Bullets:**

- Algorithm Results: High accuracy in playtesting
- Overcoming Challenges: Merging logic with UI
- Future Integrations: IGDB/Steam APIs & Social Sharing
- Questions & Answers

Speaker Notes (Script):

"Thanks, Liss. So, how did GameMatch AI actually perform? During our team testing and peer reviews, the algorithm's accuracy exceeded our expectations. Users felt the recommended games genuinely aligned with their quiz inputs, proving our weighting system was mathematically sound.

Naturally, we faced challenges. Merging Julien's complex PHP scoring logic with Liss's dynamic JavaScript frontend required tight coordination and a lot of debugging to ensure the data passed smoothly without breaking the UI. It taught us a lot about version control and team communication.

Looking to the future, we have big plans to level up GameMatch AI. Rather than manually updating our database, we plan to integrate live APIs like IGDB or Steam to pull real-time game data, pricing, and cover art. We also want to add social sharing features so users can post their match results, and potentially integrate more complex machine-learning models to refine recommendations over time.

We are incredibly proud of what we've built, and we hope you enjoyed learning about GameMatch AI. Thank you for your time, and we would now love to open the floor to any questions you might have."
